

Industrial Engineering

Visualize / Integrate / Execute

Industrial Systems Integration

Let us know what you would like as your 'to be' state, and we will take your project from concept through design, installation, integration and production. We are a one stop shop that will execute on a complete production lines to meet your specifications.

Production Line Relocation

To relocate a line, we create a CAD layout of the existing line, review systems requirements for that line, dismantle and transport the line to its new location, unload and reinstall the line, and finally do a site review and systems review of utilities.

Facility Closure & Demolition

We evaluate your scope of work, generate a value-added concept and provide timing and cost. We then conduct an asset review of your equipment and cross check 'sister' plants for usability before removing and transporting assets being relocated. Lastly, we disassemble and scrap unused or unnecessary assets before returning the building to the original condition.

Maintenance Repair & Refurbishment of Existing Production Equipment

We repair, emergency repair, and refurbish equipment with updated technology and safety upgrades.
